

The Puzzle of Multiple Sclerosis from 1868 to 2007

This book focuses on clinical research on Multiple Sclerosis during the nineteenth century and then begins with biological research on this disease beginning at UCSF in 1960 followed by the author's unique experiences in trying to solve this puzzling problem beginning not just as a clinician having dealt with hundreds of cases but also as a delegate on MS conference around the world from 1977 to 1994. It challenges current thinking, specifically, that MS is an autoimmune disease that continues through 2006. The author submits that it is not by virtue of intuitive reasoning.
